polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-CO
library is a subtracted library derived from the UI-R-Al
and UI-R-El libraries. The UI-R-Al library consisted of a
mixture of individually tagged normalized libraries
constructed from rat placenta, adult lung, brain, liver,
kidney, heart, spleen, ovary, and muscle. The UI-R-El
library consisted of a mixture of individually tagged
normalized libraries constructed from 8, 12 and 18-day
embryo. The tag is a string of 3-5 nucleotides present
between the Not I site and the oligo-dT track which
allows identification of the library of origin of a clone
within the mixture. The subtracted library (UI-R-CO) was
constructed as follows: PCR amplified CDNA inserts from a
pool of UI-R-Al and UI-R-El clones from which 3' ESTS had
been derived was used as a driver in a hybridization with
the pooled UI-R-Al and UI-R-El library in the form of
single-stranded circles. The remaining single-stranded
circles (subtracted library) was purified by
hydroxyapatite column chromatography, converted in the number
of the pooled of column chromatography.
                double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-CO library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /map="6p21.3; 5q33"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gene sequence shown below is considered a pseudogene because of the terminating codon at base 429. There are only two additional single-base differences between the coding sequences of the zeta and pseudogeta genes, although there are conspicuous differences in the 5' and 3' flanking regions. Moreover the first intron of this locus demonstrates length variation, apparently stemming from the repeat sequence 'acaytygyagygy' which is also found in the zeta gene and, in a similar form,in the 5' flank of the human insulin gene. The repeat sequence 'cgggg' is characteristic of the second introns of the zeta genes [1].

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         upstream initiation codon.

IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for small overlap between neighbouring submissions.

Cosmid E94 lies between E7 and E126 on the AseI-E genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      http://www.nih.go.jp/
jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22/22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Submitted (12-APR-1999) Streptomyces coelicolor sequencing project, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA E-mall: barrell@sanger.ac.uk Cosmids supplied by Prof. David A.    Provides information with a variety of potential agonists or subunit combinations with a variety of the function and should status for compounds that are capable of very specific interaction with one or mover receptor subunits and should lead to the function and design of the unital agonists of the compounds to the subunit specific antibodies may be used to monitor the distribution and expression density of various subunits in normal vs diseased brain tissues. Testing of single receptor subunits on specific receptor subunit combinations with a variety of potential agonists or antagonists provides information with respect to the function and activity of the individual subunits and should lead to the identification and design of compounds that are capable of very specific interaction with one or more receptor subtypes. The resulting drugs should exhibit fewer unwanted side effects than drugs identified e.g. screening with cells that express a variety of subtypes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 9; Fig 1; 108pp; English.

The polypeptide induced in macrophages by lipopolysaccharide stimulates cell prolification (esp. when costimulated with IL-4) promote activation, cytotoxicity, and mobilisation of LAK cells; promote recruitment of suppressive peritoneal exudate cells; promote generation of immunocompetent lymph node cells (LMC) and have trypanocidal and trypanolytic activity. The human and murine sequences are given in (Q51543-45), peptide fragments able to generate antibodies are given in (R51951-61) sequence 3861 BP; 542 A; 1241 C; 1292 G; 658 T;
New isolated nucleic acid encoding the new human cytokine Tango-77 used to inhibit inflammation and to screen for specific modulators Example 5; Figure 3; 226pp; English.

X03956-X03048 and X2301-X2304 are overlapping BAC genomic sequences containing alternatively spliced forms of human II-Ira. Such fragments are used in the method of the invention which describes the isolation a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is inflammation by binding to the interleukin-1 receptor (II-IR). It may also bind to a new receptor so could regulate other cellular processes associated with acute or chronic inflammation, e.g. asthma, chronic

The specification describes antisense oligonucleotides (X52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides

It may also induce or suppress interleukins, cytokines are growth factors. Modulators of this protein are used to treat or prevent conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex.

New recombinant Herpes Simplex Virus vaccines - rendered avirulent by deletion of ICP 34.5 gene encoding active gene prod. Disclosure; Fig 1; 78pp; English.

Herpes simplex virus-1 (MGH-10) was isolated from a recurrent facial vesicle and passaged a maximum of four times in cells in culture. Viral DNA was prepd. from virons that accumulated in the cytoplasm of infected VERO cells (Kieff et al., J. Virol., 8, 125-132 (1971)). The BamHI SP junction fragments contg. the domain of the gene that specified ICP34.5 were cloned into a pUC18 plasmid using HSV-1(F) sequences as probes in colony blot hybridisation. Further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oligonucleotides (specifically X55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastasses, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer.

HSV may be rendered avirulent by removing the ICP34.: gene from the viral genome. The modified HSV genome is useful for preparing a stable, non-transforming live viral vaccine which either does not establish latent infections or which cannot be reactivated from a latent state.
